

**AMENDMENTS TO THE SPECIFICATION:**

The abstract is amended as follows:

A safety container includes a container main body, an internal cap ~~econfigured~~ to be fit to an opening part of the container main body, and an external cap ~~econfigured to be fit to the internal cap rotatably and moveably in upper and lower directions.~~ The external cap is not rotated with the internal cap in a case where only the external cap is rotated in an opening direction. The external cap is rotated in a state where the external cap is pressed toward an internal cap side ~~so that the external cap and the internal cap are engaged and the internal cap is opened and separated from the container main body.~~ The safety container ~~further comprises~~ includes an inner ring having an end part where an engaging part engaged at a top part of the opening part of the container main body is provided and another end part where a slide contact part is provided. The internal cap is rotated with the external cap while the internal cap slides and contacts the slide contact part, by rotating the external cap ~~in the opening direction~~ in a state where the external cap is pressed toward the internal cap side until a rotation angle reaches a designated angle.
